COLOUR +

MODE OF ADDRESS

I loved the colour palette used in this website. I think they go really well together, especially to advertise drinks. I think the colour makes the design of the website quite cool and refreshing.

TYPOGRAPHY

I liked the font used in this website, especially how they make the letters joint/connected in the name. I found it visually appealing on how parts of the lettering in the font is bigger and some is smaller. I think it looks fun and makes the overall look more interesting.

COLOUR +

MODE OF ADDRESS

This website is also a good example of the sort of animatic style I would want to try and achieve. The art style and colour palette is also what I would ideally want to implement into my own website.

NAVIGATION

What I loved most about this website was how interactive it is. Almost every item you hover over or click on has it's own little animation, which I think makes the website so much more interesting to the user.

LAYOUT & NAVIGATION

REDBUBBLEhttps://www.redbubble.com/

My favourite part about the Mana Yerba Mate website how well its layed out. You'll find that when you visit the website, and move your mouse, the can on the screen will move but also if you use ctrl and your mouse to zoom in or out, different navigation tabs on the website will change position to suit your screen size or zoom. I found this feature really memorising and makes the website all the more interesting.

What I liked most about the website Redbubble was how it was layed out, in terms of the different products available. I thought that it was easy to look at it, and was simple enough to navigate.

LAYOUT AND NAVIGATION

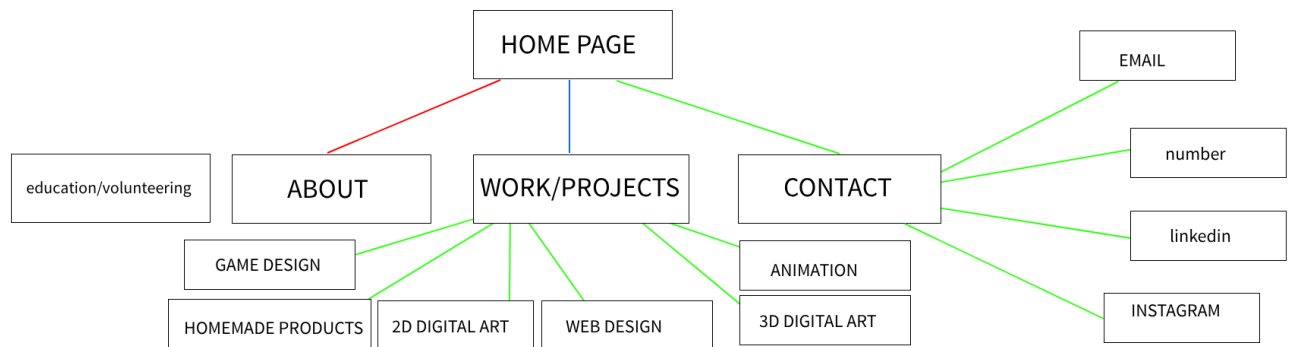

I liked how this website had each of their products and options layed out in separate boxes. It wasn't cluttered or messy in any way, which makes it easy to view and navigate. I like how they labeled the products under each box, and how they included

LAYOUT

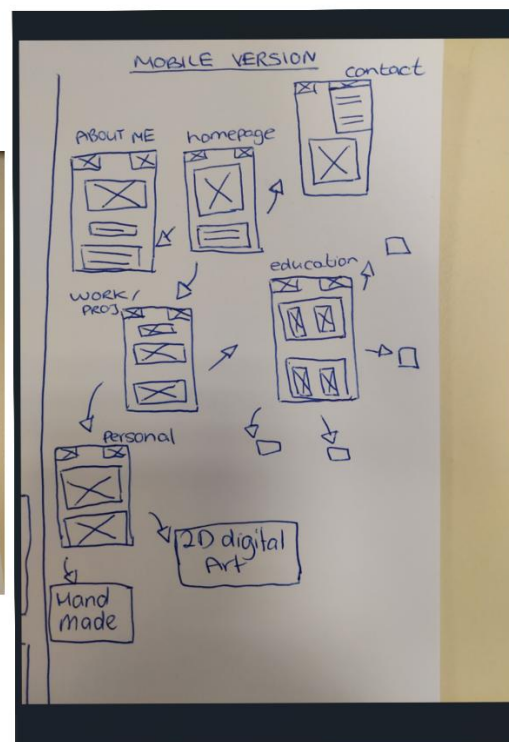

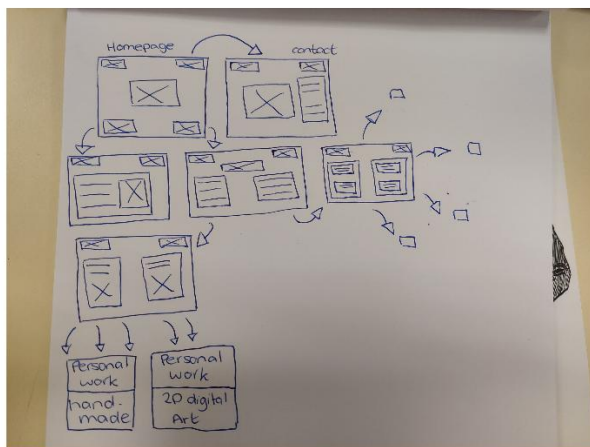

I liked how this website displayed some of their products over the webpage. I thought it was a good idea to use it if I wanted to get rid of any white space on my own website that I will work on.

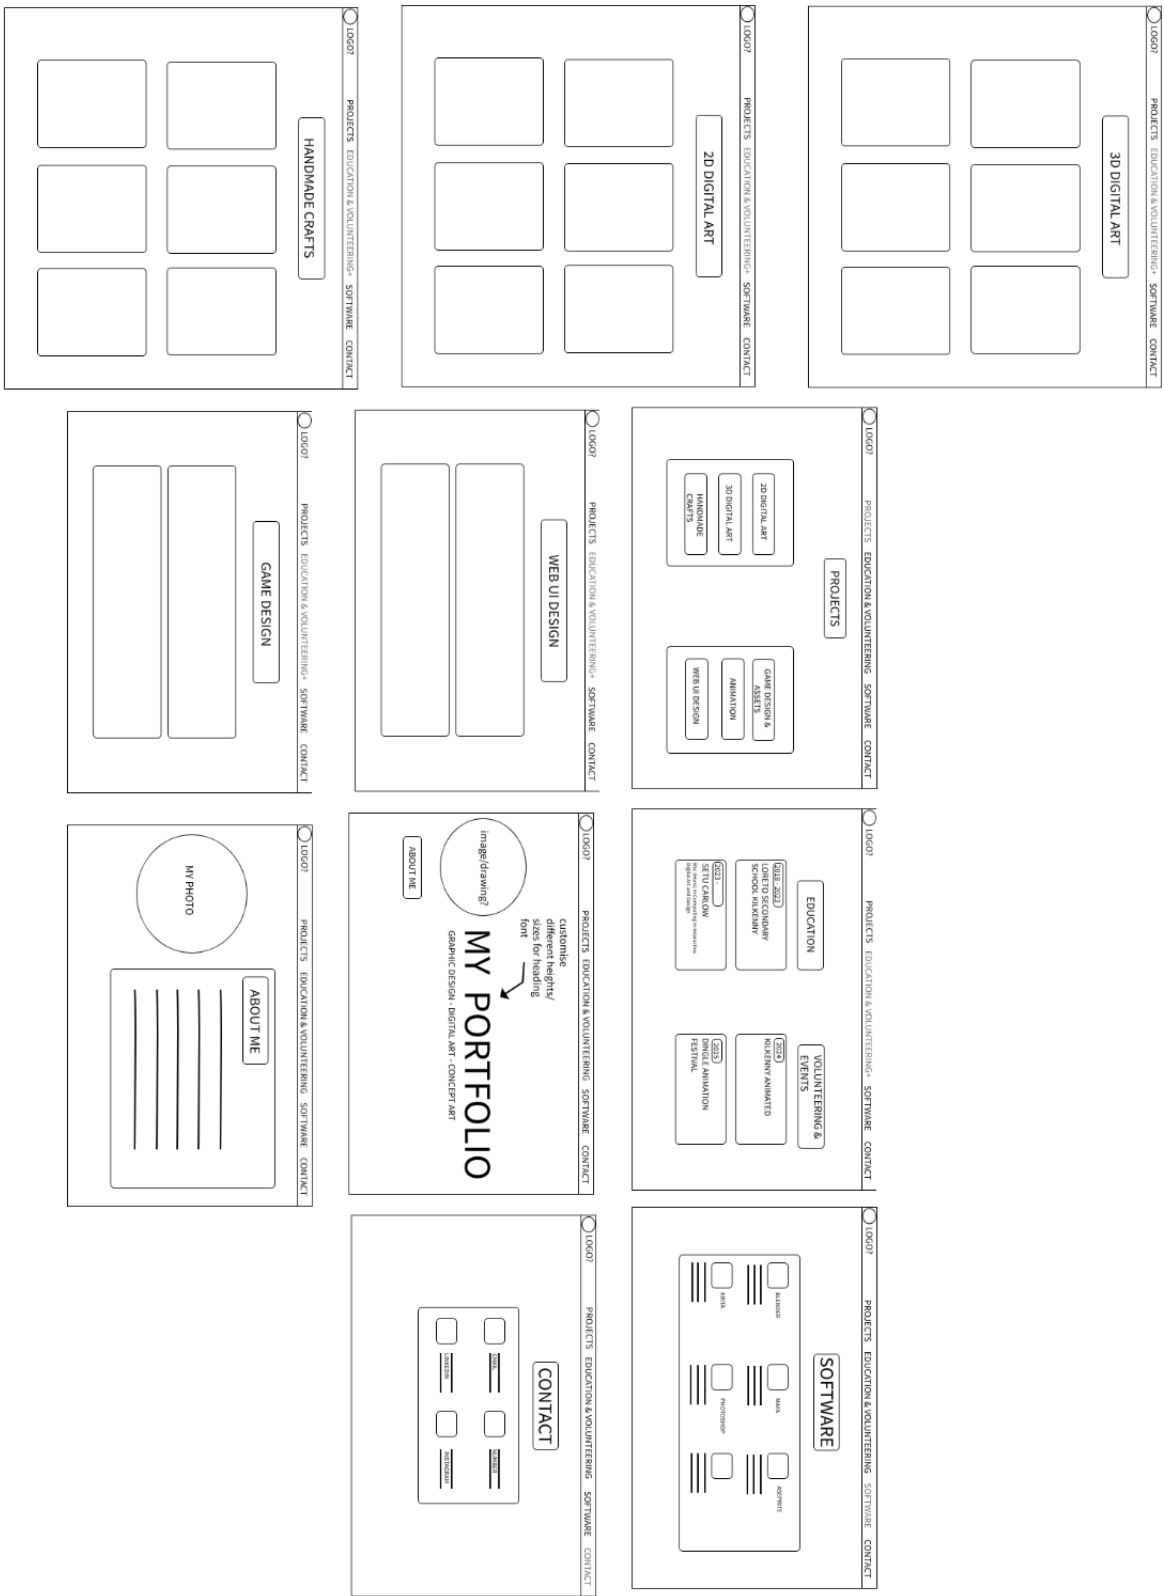

## 1. Structure:

## 2. Paper Prototypes

3. Medium Fidelity prototype

## 4. High Fidelity Prototype

## What I changed from my High-Fidelity Prototype to my finished website

1. **Added a moving background** – I did this because I didn't like how boring it looked with just a solid colour in the background. And I didn't have any images I wanted to place around the page without making it look crowded.
2. **I made the big cat image into a gif that spins in place** – I did this to add some more movement to the page. To make it more visually appealing.
3. **I put all my software on my "About Me" page** – I did this because the individual software page would have been really small and bare. This way, I could fill up some empty space and also add some more colour to my about me page, from the software icons.
4. **Made the text under "Portfolio" move** – I experimented with this a few times, to try and add some more movement on my page. I did google a bit on how to work out some of the issues I was having with it. I thought it fit well with my pixel like background and titles, kind of giving it a retro/videogame look.
